- London
- South East Coast

"Improving quality is about making health care safe, effective, patient-centred, timely, efficient and equitable." (The Health Foundation, 2013)

## What is a Bundle ?

A bundle is a structured way of improving the processes of care and patient outcomes: a small, straightforward set of evidence-based practices — generally three to five — that, when performed collectively and reliably, have been proven to improve patient outcomes.

They help health care providers more reliably deliver the best possible care for patients undergoing particular treatments with inherent risks.

## What makes a bundle so special?

The power of a bundle comes from the method of execution.

A bundle ties the changes together into a package of interventions that people know must be followed for every patient, every single time

Care Bundle TIA F.A.S.T. Stroke Unit Patient  
Thrombolysis Myocardial Infarction  
Improvement Quality  
Stroke STEMI PCI MI Care  
CVA

## What's the difference between a bundle and a checklist?

A checklist can be very helpful and an important vehicle for ensuring safe and reliable care. The elements in a checklist are often a mixture of *nice-to-do* tasks or processes (useful and important but not evidence-based changes) and *have-to-do* processes (proven by randomized control trials). A checklist may also have many, many elements.

## Stroke Care Bundle

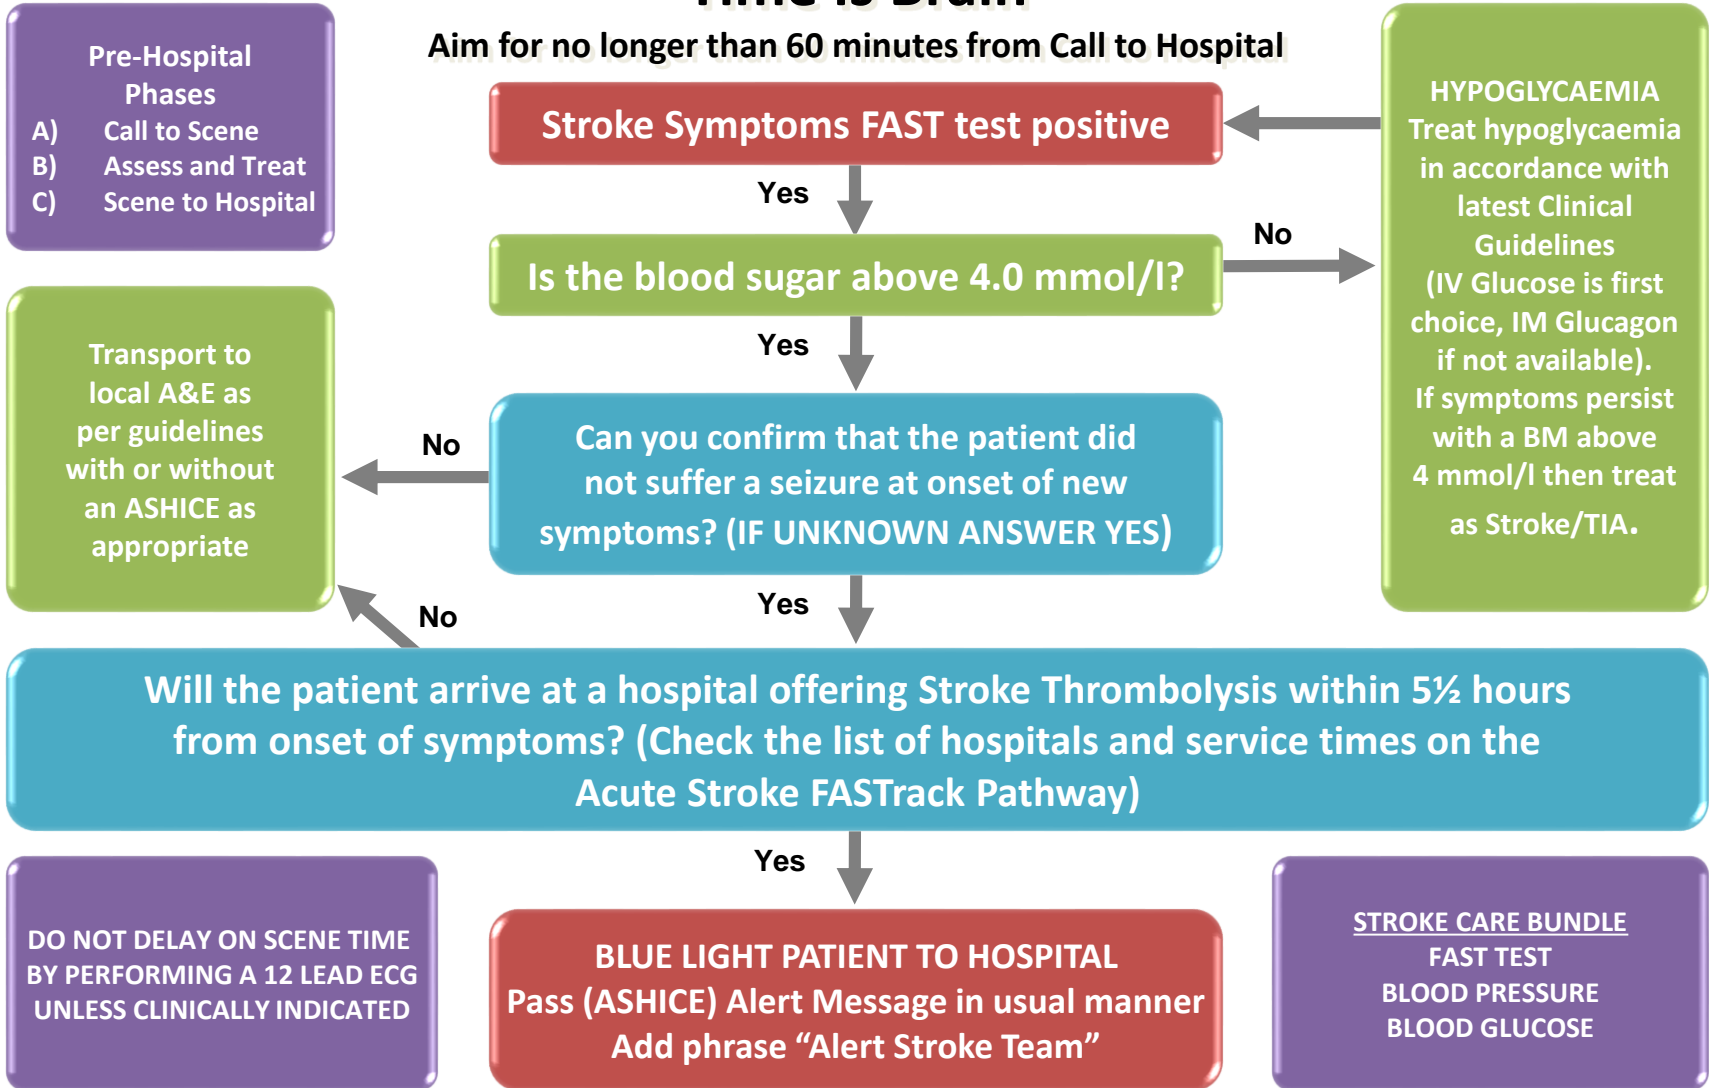

- FAST
- Blood Glucose recorded
- Blood Pressure
- Symptom onset times

# Acute Stroke FASTrack Pathway v4.03

## 'Time is Brain'

Aim for no longer than 60 minutes from Call to Hospital

## Code Yellow Sepsis Pathway

A screening tool and care bundle that emphasises a rapid diagnosis, early treatment and rapid transport for antibiotic therapy.

The pathway aims to ensure that patients receive intravenous antibiotics within **one hour** of clinician diagnosis.

The sepsis six is a **resuscitative care bundle**, stating six simple tasks to be completed within the first hour of diagnosis:

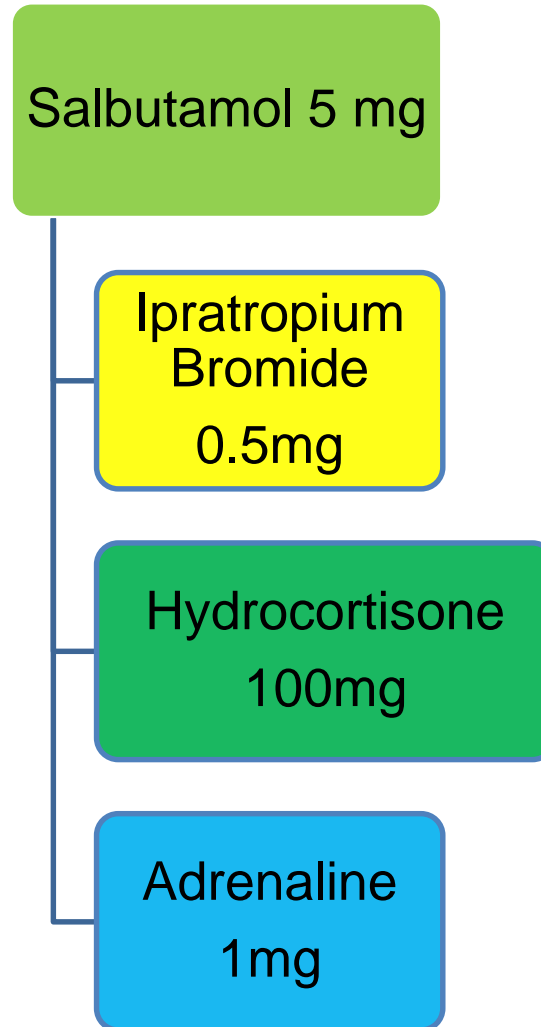

- Give High Flow Oxygen
- Give Intravenous Fluids
- Give Intravenous Antibiotics
- Take blood Cultures
- Take Venous Lactate
- Take Urine sample/monitor Output

The care bundle can be started in the out of hospital environment, recognising sepsis early, transporting rapidly whilst administering high flow oxygen and intravenous fluids.

## Asthma Care Bundle

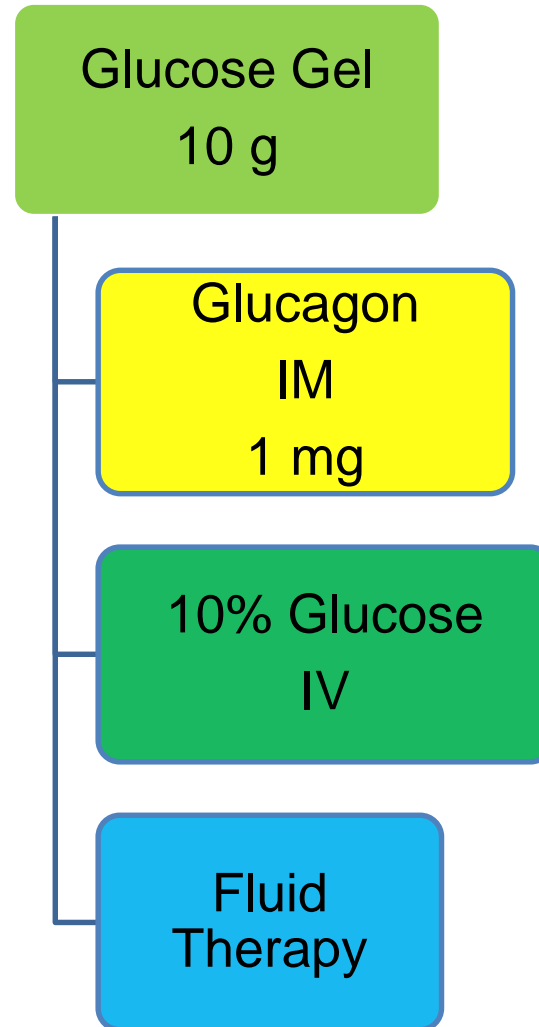

- Respiratory Rate
- Oxygen Saturation (SpO<sub>2</sub>)
- Document oxygen given
- Pre and Post peak flow rate
- Salbutamol given

## Hypoglycaemia Care Bundle

- Pre treatment blood glucose level
- Treatment recorded
- Post treatment blood glucose level
- Referral for non conveyed patients

## Febrile Convulsion Care Bundle

- Anticonvulsant given
- Blood Glucose level
- Temperature recorded
- Temperature management
- Oxygen saturation (SpO<sub>2</sub>)
- Oxygen Therapy
- Discharge or referral

## Isolated Limb Trauma Care Bundle

- Assess distal circulation
- Immobilisation of limb
- Pre and Post analgesia pain score
- Analgesia given
- Oxygen Saturation (SpO<sub>2</sub>)
- Oxygen Therapy

## STEMI Care Bundle

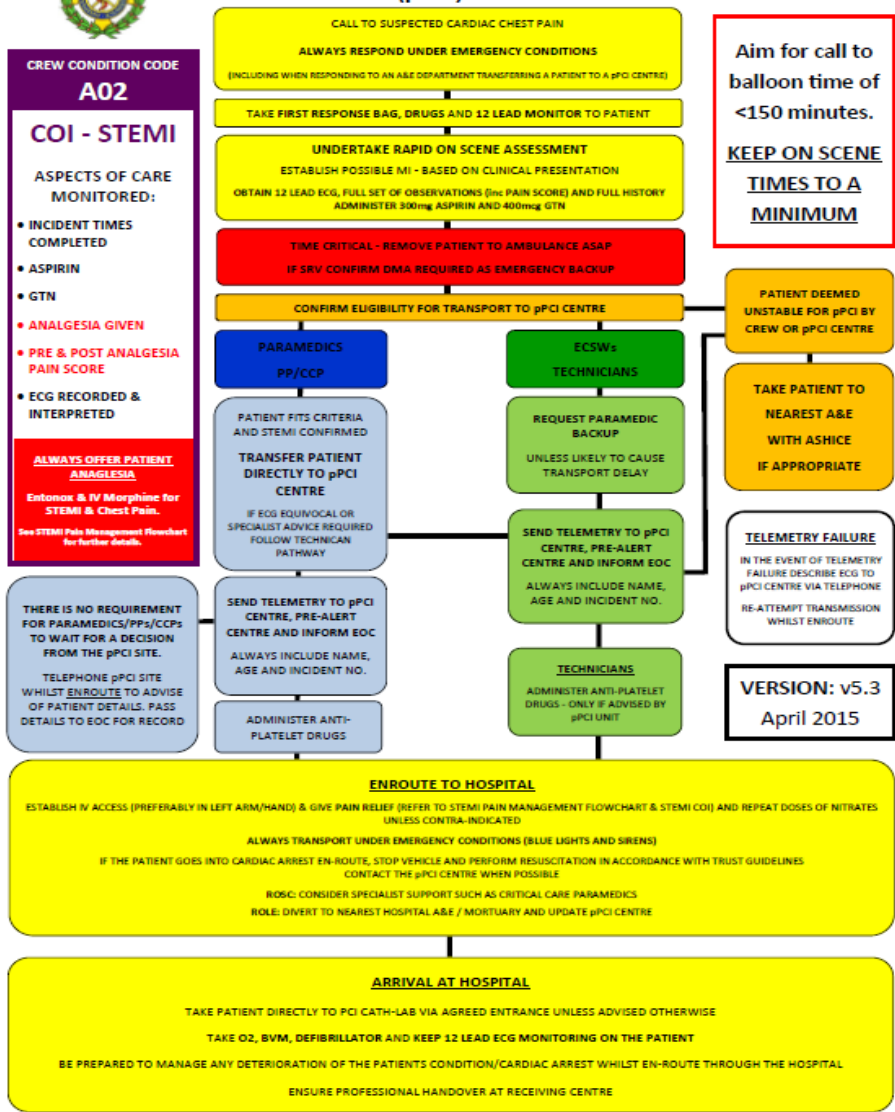

- Defibrillator (Lifepak) immediately available
- Aspirin
- Glyceril Trinitrate (GTN)
- Pre and Post Pain Score
- Analgesia
- ECG recorded and interpreted

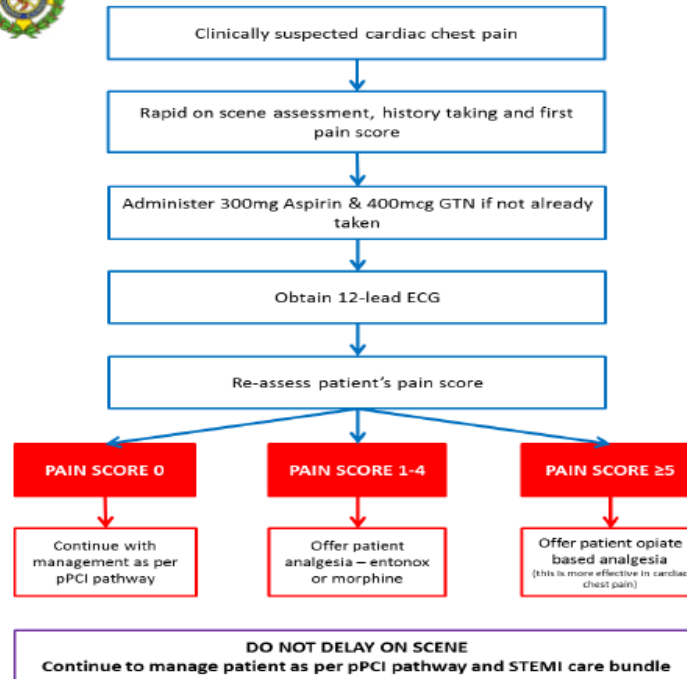

### STEMI (pPCI) PATHWAY

### STEMI PAIN MANAGEMENT

### CRITERIA

- In any patient with ST segment abnormalities (elevation or depression) Myocardial Ischaemia or Infarction must be considered.
- ST Elevation Myocardial Infarction (STEMI) can be diagnosed by the presence of >1mm (0.1mV) of new or presumed new ST segment elevation in 2 or more adjoining precordial leads, or in III and AVF (usually also in II).
- ST Elevation of >1mm (0.1mV) in aVR indicates occlusion of the Left Main Coronary Artery.

### ECG LEADS

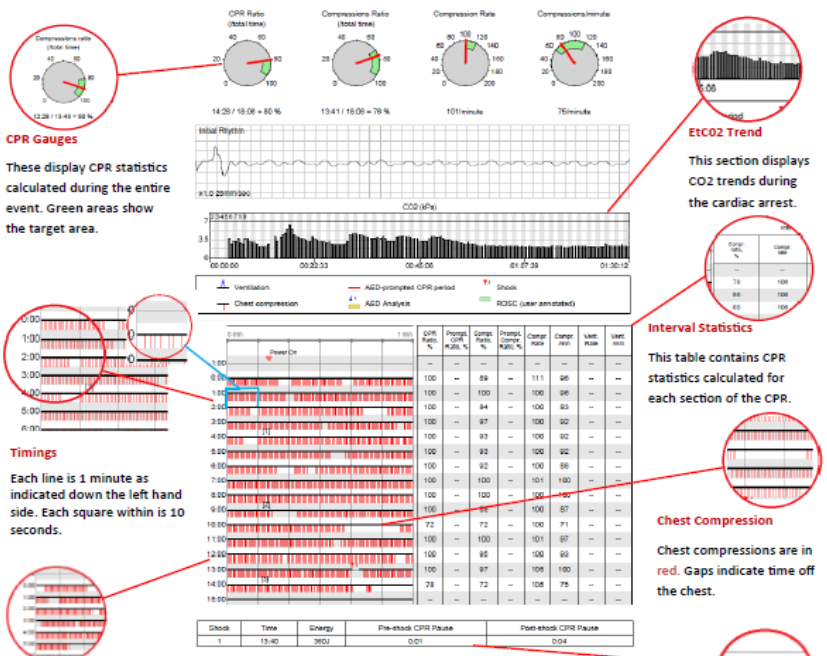

I lateral	aVR LMCA	V1 anterior	V4 anterior
II inferior	aVL lateral	V2 anterior	V5 lateral
III inferior	aVF inferior	V3 anterior	V6 lateral

## Cardiac Arrest Downloads

As soon as the pads are applied and the LIFEPAK® 12/15 is turned on, data is being collected. After a resuscitation, data can be transmitted from the LIFEPAK device to CODE-STAT software. A report will then be compiled by the Quality Improvement team to annotate and pass along to all clinicians involved while the incident is still fresh in their minds.

- If using a LP 1000 or an FR2 in a cardiac arrest please ensure that the **LIFEPAK 12 or 15 is attached at the earliest opportunity**, irrespective of the cardiac rhythm.
- **Don't forget** - At some point prior to turning the LIFEPAK off, enter the patient's details into your Lifepak, just like you would with pPCI transmissions. **Please can you include an incident number with this.**
- Following your resuscitation attempts whether this be applying ROLE or ROSC at hospital **you are now able to transmit this data!**
- The transmit location is **"CLINICAL AUDIT"**. Transmit just as you would with pPCI, double checking it is the resus data and not any post ROSC 12 leads or other patient data. Make sure Report is filtered to **"ALL"**.
- If you have turned your LIFEPAK off, this is OK, just head to **Archives** by pressing **Options**. If you haven't entered any patient details select **Edit** and complete relevant fields. You can then transmit the data.
- You will receive your summary not long after, no feedback will be given, just self reflection!

**CPR Quick-View**  
CPR Quick-view is a continuous time scale displaying compressions (red lines) and ventilations in blue. This is broken down to calculate statistics.

**CPR Pauses for Shocks**  
This section will show you how long the pauses are in chest compression Pre and Post shock.

## What is the code summary telling you?

CPR gauges display CPR statistics calculated during the entire event. The goal is to have needles within green parameters.

### CPR Ratio

This determines the overall performance of CPR. It shows the proportion of the time uninterrupted CPR was performed for the entire case, accounting for CPR related interruptions shorter than 10 seconds.

### Compression Ratio (Hands on Time)

This determines the "hands on time." It gives the proportion of the time uninterrupted chest compressions were performed.

Interruptions greater than 3 seconds in chest compressions will count against overall figure.

### Compression Rate

This determines the rate in which chest compressions were performed.

### Compressions per minute

This determines the average number of chest compressions delivered in one minute. This will usually be less than the compression rate as it includes pauses for ventilations and pulse checks.

### CPR Quick View

CPR Quick-View is a continuous time scale displaying compressions—each red line representing 1 compression and ventilations show in blue. This is broken down to calculate statistics.

### Timings

Each line across the table represents one minute, as indicated down the left hand side. Each square within this is 10 seconds. You are then able to see pauses (no red lines) in compressions and estimate how long this was for.

### Interval Statistics

Prompt	Compr. Rate	Compr. Rate	Compr. Rate
Compr. Ratio, %			
--	--	--	--
--	111	96	--
--	--	--	--

### Interval Statistics

This table to the right of your CPR quick view contains the CPR statistics calculated for each section of the CPR attempt.

### Other features on your code summary

- Initial rhythm
- EtCO2 trends during the cardiac arrest
- At the bottom of your report you are also able to see a table detailing the pre and post shock pauses.

### Things to remember

- Manual override on Lifestak 1000
- Use metronome to maintain chest compression rate between 100-120bpm
- Aim for no more than 5 seconds off the chest at any time
- Adherence to Protocol C for VF and pulseless VT

### Calculation of care bundle delivery and valid exceptions

Patient ID	Care bundle criterion 1	Care bundle criterion 2	Care bundle criterion 3	Care bundle delivered?
1	✓	✓	✓	Yes
2	✓	✓	x	No
3	✓	Exception	x	No
4	Exception	Exception	x	No
5	✓	✓	Exception	Yes
6	Exception	Exception	✓	Yes
7	Exception	Exception	Exception	Yes

## New Care Bundles

- Care of Elderly patients
- Care of patients experiencing mental health (self harm)
